The information contained within this manual including any translations thereof, is the property of Maguire Products Inc. and may not be reproduced, or transmitted in any form or by any means without the express written consent of Maguire Products Inc.

To every person concerned with use and maintenance of the Maguire MS4 4-Roller Pump it is recommended to read thoroughly these operating instructions. Maguire Products Inc. accepts no responsibility or liability for damage or malfunction of the equipment arising from non-observance of these operating instructions.

To avoid errors and to ensure trouble-free operation, it is essential that these operating instructions are read and understood by all personnel who are to use the equipment.

Should you have problems or difficulties with the equipment, please contact Maguire Products Inc. or your local Maguire distributor.

These operating instructions only apply to the equipment described within this manual.

**Accuracy of this Manual**

We make every effort to keep this manual as correct and current as possible. However, technology and product changes may occur more rapidly than the reprinting of this manual. Generally, modifications made to the pump design or to the operation of the software are not reflected in the manual for several months. The date at the footer of this manual indicates approximately how current this manual is. Likewise, your pump may have been produced at an earlier time and the information in this manual may not accurately describe your pump since this manual is written for the current line of pumps in production (as of the date in the footer). We always reserve the right to make these changes without notice, and we do not guarantee the manual to be entirely accurate. If you question any information in this manual, or find errors, please let us know so that we may make the required corrections or provide you with accurate information. Additionally, we will gladly provide you with an updated copy of any manuals you need at any time. We welcome comments and suggestions on ways we can improve this manual. For additional information, or to download the latest copy of this manual or any other Maguire manual, please visit our website or contact us directly.

Principles of Pump Operation

The MAGUIRE PeriStep™ pump is designed for years of rugged industrial service with little or no maintenance. Only the inexpensive pumping tube needs to be replaced from time to time to keep these units performing like new.

Metering is accomplished by the compression and release of a flexible pumping tube. These peristaltic pumps are true positive displacement pumps. Unlike other positive displacement pumps such as piston, gear, diaphragm, and rotary screw pumps, a peristaltic pump has no seals, check valves or clearances to allow even the slightest internal leakage. Liquid is retained within a flexible tube at all times and never comes into contact with any surfaces of the pumping mechanism. There are no check valves used at all.

Where tubing passes through the pump head, rollers alternately close off a portion of the tube and squeeze the liquid inside the tube forward by rolling over the tube in the forward direction. As the tube behind the roller springs back to its original round shape, the expanding inside cavity creates a vacuum that draws liquid into the tube. At least one roller is always in the position of closing off the tube completely, thereby assuring that no liquid can “leak” backwards.

Pumping is so complete that this type of pump can pump air as effectively as liquid and can develop a near full vacuum of 30 inches of mercury. These pumps are self-priming and will pass any entrapped air bubbles in the liquid through the pump without loss of prime.

A highly accurate stepper motor drives the pump’s rollers. As the rollers move over the tube, they cause the liquid inside to be squeezed forward in small uniform increments. The accuracy of these pumps for metering small amounts of viscous liquids is unmatched.

Principle of Controller Operation

Contact closure, *or 24 - 120V ac/dc screw signals are fed to the MS4 via the black (+) and white (-) wires of the signal cord for extrusion and injection molding applications.

*MS4 pumps sold prior to 2017 utilize a contact closure only screw signals.

The MS4 will also work for extrusion following applications by being fed variable 0-10 V DC via separate the red and green wires of the signal cable.

Unlike any previous liquid color pump, the MS4 PeriStep™ liquid color pump has an input parameter for the liquid color density (lbs/gal or kg/l). Because of this, no weight calibration is required. Simply enter in the liquid color density that you are metering, and set the tube color (green, red, or clear) that you are using with the pump. With the correct data entered, the MS4 will always provide accurate, consistent throughput.

When used in cycle mode, the speed of the stepper motor is automatically controlled by the internal microprocessor to allow color metering to occur uniformly over the entire screw return cycle. The operator will need not concern himself with motor speed adjustment. Changing cycle times or fluctuations in plant voltage are automatically detected and compensated for and, therefore, will have no effect on metering accuracy.

Two innovations are key to the MS4 PeriStep™ liquid color pump. Instead of a standard motor, the drive system is a stepper motor whose shaft rotates in discrete, minute increments that make possible precision and repeatability of movement. This motor drives a central "sun" roller, whose motion transfers to the "planetary" rollers that provide the compression / relaxation cycle of a peristaltic pump. The sun roller drives the planetary rollers by means of friction contact, providing a 5 to 1 speed reduction without a gear box.
Pump Tubing & Throughput Specifications

The MS4 PeriStep™ liquid color pump utilizes the same 3 tube sets that our traditional MPA series pumps utilize. The tube sets are: green, red, and clear. They vary in size according to their color. Larger tube will offer a higher throughput capability, whereas smaller tubing will offer higher resolution. A choice should be made according to the user’s specific application.

The MS4 PeriStep™ liquid color pump will ONLY operate properly with the 3 choices of Maguire supplied tube sets. Maguire tubing is readily available. Refer to our part numbers listed below when ordering.

- Pump tube only: tur35

1/4" Clear
- Pickup assembly: at06
- Pump tube with fittings: at09
- Pump tube only: tur46
Description of Controls

1. **ON/OFF SWITCH**
   The power switch is simply the internal connection between the pump’s power cord and the pump’s power supply. This switch has an internal indicator light that will glow when it is switched on and 120/230 VAC is present.

2. **RUN SWITCH**
   This switch must be set to “RUN” mode anytime the pump is to be operational. Alternatively, this switch must be set to “STOP” anytime an operator needs to run the “PRIME” or “REVERSE” functions. In order to access and sub menus via the boot-sequence, the Run switch must remain in the “STOP” position.

3. **3-WINDOW CONTROL SCREEN**
   These 3 windows serve as the pump’s display and control interface. Each window is equipped with two push buttons. These pushbuttons are used to adjust the parameter of the window, which they are located next to. Various combinations of these pushbuttons are also used during boot sequences to access the sub-menu screens.

4. **5-PIN CONNECTOR JACK**
   The 5-pin connector jack, used along with the pump’s supplied signal cable, provides two separate inputs used to interface the pump with surrounding equipment. This is where a screw signal is fed for continuous extrusion and injection molding applications, and a 0-10v DC signal is fed for extrusion following applications. The 5-pin jack/cable pin-out is as follows:
   - Pin #1 (white wire (-) in signal cable): Contact closure *or 24-120V ac/dc
   - Pin #2 (black wire (+) in signal cable)
   *MS4 pumps sold prior to 2017 utilize a dry contact closure only screw signals
   - Pin #3 (red in signal cable): Positive lead for 0 to 10 volt DC (extrusion following applications only)
   - Pin #4 (green in signal cable): 0 volt lead for 0 to 10 volt DC (extrusion following applications only)
   - Pin #5 (cable shield)

5. **PRIME BUTTON**
   When pressed and held, the “PRIME” button will run the pump’s rollers at full speed. This is used to quickly bring liquid to the end of the tubing after a tube set is installed into the pump. The run switch must be off, and the pump head must be closed.

6. **REVERSE BUTTON**
   When pressed and held, the “REVERSE” button will do exactly the opposite as the “PRIME” button. This is used to run the pump’s rollers in reverse to pull liquid away from the end of the tubing. This is typically done before changing a used tube set. The run switch must be off, and the pump head must be closed.
MS4 Pump Startup Procedure

1. Place color drum next to process machine.

2. Install pickup lance into liquid container for suction pickup of liquid, or attach tubing assembly in accordance with color manufacturer’s recommendations.

3. There should be provision for attaching the poly-tubing to the process machine so as to allow color to be metered in directly over the feed section of the screw, or into a pre-mixer if one is installed. Assuming provisions have been made, attach or install the poly-tubing to the process machine as required. (The best color mixing without color contamination of the feed throat of your machine is obtained when the color delivery tube is positioned approximately 1/2-inch over the screw at the forward edge of the feed throat toward the side of the screw that is turning downward.)

NOTE: Adaptor Plates are available from MAGUIRE PRODUCTS that mount between the hopper and feed throat. This will allow easy insertion and removal of the color delivery tube into the feed throat of the process machine.

4. Connect the power and signal cord as follows:

Plug the pump’s power cord into a standard 120 or 230 volt continuous power source. Plug the shielded 4-conductor signal cord into the 5-pin jack located on the same side of the pump. This is where a screw signal is fed to the pump in continuous mode, or a timing signal for cycle mode (see “wiring diagram” section of the manual on page 19). If the pump is being used for extrusion following, the red (+) and green (-) wires should be connected to a 0-10 VDC extrusion speed signal. A screw signal fed between the white and black wires are not required in extrusion following applications unless the operator turns on the auto-stop parameter.

5. Open the pump head by turning the hand screw counter-clockwise. Complete removal of the hand screw is not necessary. Lay the pump tube into the slot above the rollers in the pump head. The brass tube-inlet fitting should be against the right side of the pump head that faces forward.

The tube, properly installed, will be in contact with only the uppermost two rollers. The inlet end of the tube will be resting against the side of the pump head that faces forward. The tube will pass through the pump body in a nearly straight line and reappear out the other side of the pump head. Be sure that the tubing is pushed into the pump head far enough so that it is not pinched by the outer portion of the pump head when it is to be closed. Close the pump head by turning the hand screw clockwise until the top portion of the pump head meets the bottom portion firmly. This should be lightly tightened. Over tightening the hand screw is unnecessary.

6. The pump can now be turned on via the power switch. Be sure to check if the pump is set to the correct units (Imperial or Metric). **Directions on this are located on page 14.** After this is done, the user should set the mode, let down ratio, fluid density, tube color, and throughput via the main menu and sub menus. Here are detailed instructions on how to perform all of these functions:
Turn the pump on and the boot screen will appear. The top window will display the mode that the pump is currently set to. The middle will display the current tube color setting. The bottom window will display the software version. After about 4 seconds, the home screen will appear.

**Description of the Home Screen**

In Continuous mode the top window will display the lbs/hr or kg/l. In Cycle mode it will display the shot size in grams, and in Extrusion Following it will display the current maximum extruder output.

For Continuous and Cycle modes, this parameter can be adjusted at the home screen using the two buttons next to the display.

For Extrusion Following mode, the top window only displays the live throughput (because it is being controlled with a 0-10 VDC signal). Maximum extruder output (XMO) is set in a sub menu. **For instructions on how to set XMO, see page 11 for instructions.**

In all modes the middle window will display the Let Down Ratio, or LDR. This can be adjusted at any time during the pump’s operation from the home screen using the two buttons next to the middle display.

The bottom window will display the density in lbs/gal or kg/l of your liquid color. This parameter needs to be set by the user. It can be adjusted from the home screen using the two buttons next to the display.

**Setting pump to desired mode**

The MS4 pump is capable of running in three different modes:
Continuous, Cycle, and Extrusion Following. Changing modes in the MS4 is done in the program screen:

Press and hold the indicated buttons before turning power to bring up program screen

Toggle though modes using buttons next to display

Continuous

Injection Molding (Cycle Mode)

Extrusion Following

Continuous Mode

In Continuous mode, the MS4 will run the pump continuously at a rate set by the user. The top display window will be representative of the process’s lbs/hr or kg/hr. The pump will run once the run switch is on, and a proper screw signal is applied to the white and black wires of the signal cable. If the user wants to remove the requirement of a run signal, it can be done via the sub-program screen (see page 15 of the manual).

The throughput of the pump can be calculated by:

\[ \text{PHR (lbs per hour) } \times \text{LDR (let down ratio)} \]

**Example:**
- PHR is set to 100 lbs/hr
- LDR set to 2%

The MS4 will pump: \((100 \text{ lbs/hr}) \times (2\% \text{ LDR}) = 2 \text{ lbs/hr of color.}\)

Injection Molding (Cycle Mode)

In Cycle mode, the MS4 will observe the time duration of screw signal between pin 1 and 2 (white and black leads of connected cable), and automatically adjust the pump rate in order to
meet the shot size within that time interval of the screw return time. The top display window will be representative of the shot weight (part GRAM weight)

**Example:**
- Shot size set to 100 grams
- LDR set to 2%
- Contact closure time is 30 seconds.

The MS4 will pump: (100 grams) \times (2\% \text{ LDR}) = 2.0 \text{ grams of color during that 30-second time interval.}

Please note:
The MS4 will not dispense during the very first cycle as it is “learning” the approximate cycle time. After this, it will run every cycle.

### Extrusion Following Mode

In Extrusion following mode, a 0-10 volts DC signal is fed into the pump between the red (+) and green (-) wires of the attached 5-pin cable. This voltage is a direct representation of your extrusion speed. This voltage will adjust the rate of the pump accordingly. An extruder maximum output (XMO) must first be entered in the pump’s parameters. This number represents the throughput of the pump when a 10-volt signal (maximum extruder speed) is applied. Instructions on how to set XMO is located on page 11.

A screw signal between the white and black leads of the signal cable is not required when running the pump in extrusion following mode. If the user wants to make this a requirement, it can be enabled via the sub-program screen (see page 15 of the manual).

**Example:**
- \text{XMO set to 100 lbs/hr}
- \text{LDR set to 2%}
- Extrusion signal is 6.0 volts DC

The MS4 will pump: (100 \text{ lb/hr}) \times (2\% \text{ LDR}) \times (6 \text{ volts/10 volts}) = 1.2 \text{ lb/hr of color}

### Setting XMO Value

XMO must be entered within a sub menu screen, not the home screen. To do so, make
sure the pump’s run switch is set to “STOP”, and follow this flow chart:

20 seconds after parameters are set, the pump will automatically save all settings, and return to the home screen.

**X-Factor**

Three different “X-factors” can be set within the pump. The X-Factor is simply a multiplication parameter that applies to the top display window of the home screen which allows the user to enter a larger range of throughput settings. The factory default is set to
The 3 settings are as follows:

“0.1” This allows the user to enter in a value within this format: **XX.X**  
*For example, in continuous mode this setting would cover values from 0 to 99.9 lbs/hr with increments of .1 lb/hr*

“1.” This allows the user to enter in a value within this format: **XXX**.  
*For example, in continuous mode this setting would cover values from 0 to 999 lbs/hr with increments of 1 lb/hr*

“10” This allows the user to enter in a value within this format: **XXX*10**  
*For example, in continuous mode this setting would cover values from 0 to 9990 lbs/hr with increments of 10 lb/hr. If a user had “300” entered into the lbs/hr, the pump would interpret that as: 300*10 = 3000 lbs/hr.*

### Adjusting X-Factor Parameter

20 seconds after parameters are set, the pump will automatically save all settings, and return to the home screen.

---

**Tube Selection Guide**

Depending on the throughput of your specific application, use the guide on page 5 to choose a tube size for optimal performance and accuracy. Just remember to enter in the
corresponding tube color setting after you have made a choice. (In most cases the pump is sold with the factory default tube setting of “Grn”, which corresponds to 1/8” I.D. green tube sets.

Tube Selection

Any MS4 pump is capable of running the 3 available tube color selections supplied by Maguire Products. The 3 different colors vary in size to enable a wider dosing range for the MS4 pump.

The tube size setting that lets the pump know what size tube set is actually being used. Tubing size should be chosen according to the desired throughput. A larger I.D. tube will produce a greater throughput than a smaller I.D. tube given a fixed pump speed. Alternatively, a smaller tube will offer higher accuracy shot-to-shot.

In order for the pump to produce accurate throughput, the corresponding tube setting† must be entered into the pump. The tube setting can be set by following the simple menu direction below.

Throughput of tubing will begin to diminish after prolonged use, due to tube deformation. This can be compensated by slightly adjusting the tubing factor over time, or simply replacing the tube set altogether. This is typical of any peristaltic pump.

In all applications, only use Maguire supplied tube sets with the MS4 pump.

† MS4 pumps sold prior to 2017 utilize an adjustable “Tubing Factor” number instead of the three fixed options (Grn, rEd, CLr). To set older MS4 units correctly, follow the corresponding table for each color tubing:

Green (1/8” I.D.): 210
Red (3/16” I.D.): 443
Clear (1/4” I.D.): 649

Setting Tube Color Parameter
Changing Units of Measurement

The default setting on the 4-roller pump sold domestically is set to imperial units (lbs/gal). Pumps sold internationally are defaulted to metric units. If you wish to switch between the two, the parameter must be changed in a sub menu screen. To do so, make sure the pump's run switch is set to “STOP”, and follow this flow chart:

Throughput Offset Calibration

Due to the small manufacturing tolerances in the peristaltic tubing, standard pump
operation may not offer enough accuracy for some applications. In which case, the operator can calibrate the pump’s throughput to precisely match the tubing it is being used with. The offset range is ±10%. This setting is entered into throughput offset calibration screen:

The value used for this setting must be calculated using theoretical shot size or throughput (derived from the pump’s home screen display settings), and comparing that to the weight of actual dispenses from the MS4.

For example, say that the pump is set to a 100g shot weight, with a 1.00% LDR. The operator should do the following:

1. Dispense out 10 shots and weigh the total.
2. Calculate: \( \frac{\text{measured weight}}{\text{theoretical weigh}} \times 100 \)
3. In theory, this number should equal 100. If the number does not equal 100, a value should be entered into the throughput offset calibration parameter, so that when added to your calculation from step 2, equal 100.
4. After the value has been entered, the operator should recheck by repeating steps 1 & 2.

20 seconds after parameters are set, the pump will automatically save all settings, and return to the home screen.

Enabling & Disabling Auto Stop
In order to run in Continuous mode, the MS4 will require a contact closure between the black and white wires of the attached 5-pin cable. In the rare event where a contact closure is unavailable, the need for one can be bypassed. Disabling the “auto stop” feature does this.

Conversely, in Extrusion Following mode, contact closure between the black and white leads of the signal cable is not required when running the pump. If the user wants to make this a requirement, it can be enabled.

To enable or disable auto-stop, make sure the pump’s run switch is set to “STOP”, and follow this flow chart:

20 seconds after parameters are set, the pump will automatically save all settings, and return to the home screen.

High Rate Notification
If the unit is displaying a high rate notification, this means the pump is having trouble dosing enough liquid. If this happens, the user should refer to the throughput specifications (located on page 5 of this manual). Also, check to see if the proper tube set is being used, and that the corresponding tubing color setting has been properly entered into the pump (see page 13 & 14 of this manual). Additionally, check the input signals to the pump. Make sure a proper signal is being fed between the white and black wires of the signal cable, (if in continuous or cycle mode). Make sure a proper 0-10 VDC signal is present between the red and green wires of the signal cable (if in extrusion following mode).

Adjusting Display Brightness

You may want to adjust the display brightness to accommodate your specific working environments. To do this, make sure the pump’s run switch is set to “STOP”, and simply follow this flow chart:

20 seconds after parameters are set, the pump will automatically save all settings, and return to the home screen.

Changing Colors
1. Run the pump in REVERSE to empty the tube of color.

2. Remove pump tube from pump head.

3. Remove poly-tubing from process machine and coil entire tube onto top of drum. Do not disconnect any other fittings. Tape up the open end of the poly-tubing to prevent dripping of color.

4. Bring in next color drum and repeat Steps 5 & 6 of "Start Up Procedure".

**Pickup Assembly**

An inexpensive pickup assembly is fitted to the drum of color to be used. If one pump is going to run more than one color, each color drum should be equipped with its own pickup assembly.

Each pickup assembly consists of several components. All are connected together and should never be disassembled except in the case of a tube blockage caused by contaminants in the liquid color. The lance and threaded adaptor are installed directly into the lid of the drum. The other end of the tubing assembly is connected to the feed throat of the process machine. A common source of problems comes from contaminants, such as plastic pellets entering the liquid. When opening a new drum or replacing an empty one, be certain that no openings are left uncovered where contaminants could accidentally enter the liquid.

Tubing assemblies for 30 and 55-gallon drums can be fitted with an optional High Capacity Filter (Maguire part #: at10-1) that reduces the possibility of plastic pellets clogging the pump tube. It is easily cleaned by back flushing with water.

If a pickup assembly is available for every color, operators should never need to come in contact with the liquid color except when replacing an empty drum. The REVERSE button allows the operator to momentarily run the pump in reverse to drain liquid from the tube assembly back into the liquid container. Since there is no cleanup required for a color change and no color is discarded or lost, a considerable amount of coloring is saved over a period of time.

**Disassembly & Cleaning**

Note: Depending on when your MS4 was sold, the following directions may not reflect the assembly of your particular pump. These directions are intended for the disassembly and cleaning of the most recent pump head design. The latest design pump head parts can be retrofittable into older pumps if necessary.

**CLEANING THE PICK-UP ASSEMBLY**

If a pickup tube assembly must be used for a different color or if, for some other reason, it becomes necessary to clean the coloring from the inside of a pickup assembly, the following steps will make this potentially messy job easier.

1. Disconnect tubing from the process machine.

2. With the pump tube still installed in the pump head, run the pump in reverse until no more color flows from the tubing assembly.
3. Once this is done and you are assured of a continuous air passage through the tubing, the tubing assembly should be removed from the pump head and color container and placed in a large utility sink. Place one end of the tubing assembly into the spigot opening and turn on the hot water SLOWLY. Once you can see water flowing from the other end of the tubing assembly, leave the water running for about 10 minutes. This should be sufficient time to clean all remaining traces of liquid color from the tube. BE PATIENT. HOT WATER AND TIME WILL DO THE JOB FOR YOU.

4. A copper pickup lance can be cleaned in the same manner.

**Cleaning the Four (4) Roller Pump Head**

1. Open the pump head by turning the hand screw counter clockwise until the top portion of the pump head is open as far as it will go. Complete removal of the hand screw is not necessary.

2. Using a 3/32” hex key, remove the 8-32 bolts holding the clear cover plate attached to the bottom half of the pump head.

3. Using a 1/8” hex key, remove the 10-32 x 3/8” bolt located in the center of the roller set. This step may require the roller cage to be held in place to prevent rotation while removing the bolt. In some cases, it may be beneficial to gently wedge an additional slotted screwdriver in between a roller and the center rubber hub to prevent unwanted rotation.

4. Remove roller set along with the roller retainer from the center hub. Do this by gently pulling outward on the top and bottom of the metal plate of the roller set.

5. Remove the rubber hub roller by sliding it off the hub.

6. Once disassembled, clean all parts if necessary with soap and water. Inspect for worn or damaged parts.

7. To reassemble, slide the rubber roller onto the hub, followed by the roller cage. Then, carefully install the roller retainer. The roller retainer should slide onto the hub, and also fit between the rollers. Once this is fully in place, reinstall the 10-32 x 3/8 bolt, followed by the clear cover an it's fasteners.

**NOTE:** DO NOT LUBRICATE ANY PUMP HEAD PARTS. The pump works best when totally DRY with NO lubrication. Since the center drive roller relies on friction to drive the 4 tube compression rollers, any lubrication such as Liquid Color contamination will interfere with proper operation.

**Exploded View of Pump Head**
Hook-up Diagram

FOR EXTRUSION (CONTINUOUS) OR INJECTION MOLDING (CYCLE) APPLICATIONS

CONTACT CLOSURE OR 24-120 V AC OR DC
(NOTE NECESSARY POLARITY FOR DC SIGNAL APPLICATIONS)

NOTE:
MS4 pumps sold prior to 2017 REQUIRE a contact closure type signal ONLY.
Voltage signal types will damage pump's input.

RUNNING PUMP IN EXTRUSION FOLLOWING MODE
(NOTE NECESSARY POLARITY OF 0-10 V DC SIGNAL)

Internal Wiring Diagram
WARRANTY - Exclusive 5-Year

MAGUIRE PRODUCTS offers one of the MOST COMPREHENSIVE WARRANTIES in the plastics equipment industry. We warrant each Pump manufactured by us to be free from defects in material and workmanship under normal use and service; our obligation under this warranty being limited to making good at our factory any Feeder which shall within FIVE (5) YEARS after delivery to the original purchaser be returned intact to us, transportation charges PREPAID, and which our examination shall disclose to our satisfaction to have been thus defective; this warranty being expressly in lieu of all other warranties expressed or implied and of all other obligations or liabilities on our part, and MAGUIRE PRODUCTS neither assumes nor authorizes any other persons to assume for it any other liability in connection with the sale of its products.

This warranty shall not apply to any Feeder which shall have been repaired or altered outside MAGUIRE PRODUCTS factory, unless such repair or alteration was, in our judgment, not responsible for the failure; nor which has been subject to misuse, negligence or accident, incorrect wiring by others, or installation or use not in accord with instructions furnished by Maguire Products.

Our liability under this warranty will extend only to Feeders that are returned to our factory in Aston, Pennsylvania PREPAID.

It should be noted, however, that we strive to satisfy our customers in whatever manner is deemed most expedient to overcome any problems they may have in connection with our equipment.
